EXCS 'A'

REM
Assignment-2

Q1] Compare Conventional and Non-conventional Energy

Conventional	Non-conventional
1) These are traditional energy sources that have been used for decades and form the backbone of industrial development.	1) These are modern or alternative energy sources that are being developed to reduce dependence on fossil fuels and address environmental concerns.
Examples: • Coal • Oil (Petroleum) • Natural gas • Large scale Hydro Power	Examples: • Solar Energy • Wind Energy • Tidal and wave energy • Geothermal energy • Biogas and Biomass

Q2] Compare Renewable and Non-renewable sources of energy

Renewable	Non-Renewable
1) Energy derived from natural sources that are replenished continuously	1) Energy from finite natural resources that cannot be replenished in a short time.
Examples: • Solar energy - from the sun • Wind energy - from moving air • Hydropower - from flowing water • Biomass - from plants and organic waste • Geothermal - from Earth's internal heat • Tidal and wave energy - from ocean movement	Examples: • Coal • Crude oil (Petroleum) • Natural gas • Uranium (Nuclear fuel)

Q3] Compare Solar PV and Solar Thermal systems

Solar PV

- Converts sunlight to electricity
- Uses semi conductor cells
- Used for lighting, pump, rooftop power.

Solar Thermal

- Converts sunlight to heat
- Uses collectors
- Used for water heating, cooking, CSP
